#CIS106 Final Project

I made a Video Game Backlog Manager. The program stores and manages video games, as well as the progress made on them. Users can add, view, find, and delete games from the backlog. Game information is saved to a text file.

Functions such as load_games() loads previously saved games from a text file

If file not found, starts with empty list

main() loads the games as well as lists

Menu() displays the menu and all available options

add_game() allows you to put the game name, platform and genre

Options 1-3 serve to state status on game:

1-Want to play

2-Playing

3-Completed

view_games() shows the list of games you have

find_game() Allows you to find game alongside with the status of it

save_games() saves list to the file

You are also able to remove games because of delete_game() enter the number of games to delete it.
